

I have created Car rental database application. First window of application is log in window. User has to input Username and password to log in into application. It will take users input and verify that with Database. IF it finds in database it changes scene to AfterLogin window. IF user doesn't exist then it says invalid login credential and will ask for new ones.

In AfterLogin window (Menu). User can choose to view Catalog of cars, Customer with payments, Dummy table or log out.

After clicking on button Catalog of cars it will show you all cars in Database with parameters:

Vin ID, Brand name. Vehicle type, Color, Fuel Type, Availability.

User can also use Search Bar to find Cars by Brand or any other parameter

Rentable cars					
Search: keywords...					
Vin ID	Brand name	Vehicle type	Color	Fuel type	Availability
WAUAH78E26A548765	TOYOTA	SEDAN	Mauv	HYBRID	false
5UXFG43568L827904	MAZDA	SPORT	Puce	HYBRID	false
3D73M3CL3BG154585	MAZDA	CABRIO	Blue	LPG	false
1N6AD0CUXFN452859	FIAT	JEEP	Pink	GAS	false
SALAB2D49BA733483	DACIA	SEDAN	Blue	ELECTRO	false

ready for your statement

Purpose of this project is to improve in programming in Java. Get more familiar with environment called IntelliJ Idea. Application contains basic functions named above.

Purpose of this application after better implementation could be Car rental online system. There are some flaws in my Database design. That should be re-designed .
